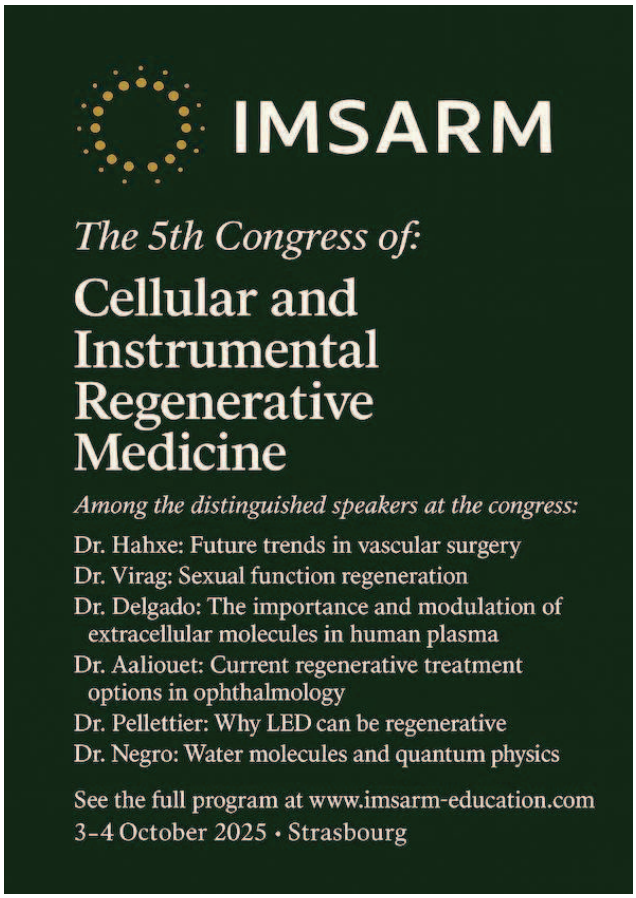
Regenerative medicine is redefining the frontiers of treatment, extending its applications to nearly every area of medicine and surgery. For vascular medicine, in particular, this discipline opens innovative horizons, offering new strategies for tissue regeneration and the management of complex pathologies.

IMSARM is pleased to announce the 5th Congress of Cellular and Instrumental Regenerative Medicine, a globally significant event that will take place in the charming city of Strasbourg, at the Hilton Hotel, on October 3 and 4, 2025.

This congress represents an essential opportunity to explore the latest advances and concrete applications that regenerative medicine offers today, with a specific focus on its implications in the vascular field. The scientific sessions will delve into how this discipline contributes to improved tissue healing and significant protection against infections and dystrophic disorders, in addition to promoting a decisive improvement in tissue regeneration, a crucial aspect for optimal organ function and for the treatment of numerous conditions.



In recent years, we have observed how regenerative medicine has elevated standards in sectors such as ophthalmology, dermatology, urology, gynecology, and neurology. For your specialty, vascular medicine, the new discoveries presented at the congress will offer valuable insights and cutting-edge strategies for your daily clinical practice.

We invite you to seize this opportunity to enrich your knowledge and contribute to the progress of a discipline that is shaping the future of health. Participating in the IMSARM congress also means connecting with a global community of leading professionals, united in the exploration and application of the most innovative discoveries in regenerative medicine.

Consider the chance to join us in Strasbourg, not only for high-level scientific updates but also to experience the atmosphere of a city rich in history and culture.

We look forward to your participation in a congress dedicated to innovation and collaboration.
